

## SkyberNet-Wireless ISP Success in the Netherlands

Internet Server Provider

*Wireless ISP offers business in the Netherlands a high-speed Internet access alternative.*

### CUSTOMER

SkyberNet International BV

### CHALLENGES

SkyberNet strives to meet the demand for increased bandwidth and provide high-speed Internet access cost-effectively to small to medium-sized businesses in the Benelux countries.

### SOLUTION

SkyberNet uses EION advanced wireless Ethernet bridges to bring high-speed Internet service to several businesses primarily in Amsterdam, Rotterdam, Haarlem and Zaanstad.

SkyberNet's growing customer base includes a trade distribution enterprise, an office furniture and supply company, and a firm that distributes electronic games. SkyberNet's point-to-multipoint wireless network delivers Internet access speeds up to three megabits per second to each customer site.

SkyberNet's fixed wireless offering appeals to small and medium-sized businesses who want high-speed Internet access without the usage restrictions involved with wired connection methods, such as DSL and cable. SkyberNet plans to build high-speed wireless networks throughout the Netherlands, Belgium and Luxembourg to provide toll-quality voice over IP services in addition to high-speed Internet access.

"Based on our research," said Maarten Meijer, SkyberNet product marketing manager, "products built with W-OFDM technology offer unmatched performance and efficiency, making them essential for many network build outs we have planned for the future."
